1. **Claims 1-20** are allowed.
2. The following is an examiner's statement of reasons for allowance:

With regard to claim 1, the prior art of record fails to anticipate or make obvious a system comprising: "a virtual private network located on a home network having a security gateway and a home agent [that is, a security gateway located on the virtual private network on the home network and a home agent located on the virtual private network on the home network] ..., ... said mobile node is associated with and connected to a foreign network, said foreign network connected to said home network, and information packets are transmitted to the mobile node [connected to the foreign network] from the virtual private network [located on the home network], and ... said security gateway ... is connected to said home agent, said security gateway having an inner tunnel address for routing packets within the virtual private network on the home network; and

*a correspondence node located on the virtual private network on the home network and coupled to said home agent ..., ... an information packet transmitted from the corresponding node [to the home agent] is encapsulated by the home agent ..., said encapsulated information packet is transmitted [from the home agent] to the security gateway using the inner tunnel address and said security gateway transmits the encapsulated information packet to the mobile node" (with emphasis).*

Clearly, the virtual private network includes a security gateway, a home agent and a correspondence node. The security gateway is connected to the home agent, and the home agent is connected to the correspondence node. The virtual private network is located on the home network, whereas the mobile node is associated with the foreign network. As recited in the claim, the foreign network and the home network are connected to each other. Inherently, the encapsulated information packet is encapsulated with the inner tunnel address as well as some destination address of the mobile node in order to forward the information packet to the mobile node. Note that there is only one home agent, located on the virtual private network, involved in the transmission of the information packet.

With regard to claim 8, the prior art of record fails to anticipate or make obvious a system comprising: "a foreign network coupled to and associated with a mobile node;

a virtual private network located on a home network and having a public home address and a home agent located on the virtual private network;

a virtual private network gateway [located on the virtual private network] coupled to said home agent and receiving information packets entering and leaving the virtual private network, with *a virtual private network tunnel inner address used for routing packets to the virtual private network gateway from the home agent [located on the virtual private network]* ... and *a virtual private network gateway address used for routing packets to the virtual private network gateway transmitted from at least one mobile node located outside the virtual private network on said foreign network*;

the mobile node location on the foreign network is designated by a care-of address; and

*the virtual private network tunnel inner address and virtual private network gateway address ... for tunneling information packets to and within said virtual private network*" (with emphasis).

With regard to claim 16, the prior art of record fails to anticipate or make obvious a method comprising the steps of: "providing a virtual private network on a home network with a home agent located on said virtual private network on the home network, said virtual private network being associated with a mobile node connected to a foreign network;

providing a security gateway located on the virtual private network [on the home network] and connected to the home agent [on the virtual private network] on the home network and the correspondence node [on the virtual private network] connected to [said] foreign network, *said security gateway ... being designated with a gateway address for routing information packets to the virtual private network and having an inner tunnel address for routing information packets to the security gateway from the home agent ...;*

forming an information packet associated with a corresponding node on the virtual private network [on the home network] for transmission to the mobile node;

*transmitting the information packet to the security gateway using said inner tunnel address ...;*

*encapsulating the information packet at the security gateway; and*  
*forwarding the information packet to the mobile node without using an external*  
*home agent" (with emphasis).*

In order to transmit the information to the security gateway using said inner tunnel address, the information packet must be "labeled" or encapsulated with said inner tunnel address. As recited in the claim, the information packet is then explicitly encapsulated at the security gateway, with some destination address of the mobile node, in order to forward the information packet to the mobile node. Note that there is only one home agent, located on the virtual private network, involved in the transmission of the information packet.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
